

Text functions, Paste Special.

① How does the concatenate functions work, and can you give an example?

→ The CONCATENATE function in excel is used to join two or more text strings into one single text string. It helps combine data from different cells such as first name and last name. The function takes multiple arguments and joins them in the order specified.

Syntax:

= CONCATENATE (text1, text2, ...)

example:

If cell A1 contains "Omkar" and B1 contains "R", then

= CONCATENATE (A1, " ", B1)

will return "Omkar R".

② Difference between left, Right, and mid functions

The left, Right, and mid functions are text functions used to extract characters from a text string.

- LEFT extracts characters from the beginning of the text
- Right extracts characters from the end of the text
- mid extracts characters from the middle of the text.

example:

If A1 = "EXCELTOLS"

- = left (A1, 5) $\rightarrow$ excel
- = Right (A1, 5) $\rightarrow$ Tools
- = mid (A1, 6, 5) $\rightarrow$ Tools

③ How would you use the trim function to clean up text in a cell?

The Trim function removes extra spaces from text leaving only single spaces between words and removing leading and trailing spaces.

Syntax:

= TRIM (text)

example:

If A1 contains "excel functions" = TRIM(A1)
Returns "excel functions"

④ explain the use of the upper, lower and proper functions

These functions are used to change the case of text:

- upper Converts text to uppercase
- lower Converts text to lowercase

proper capitalizes the first letter of each word

example
If A1 = "excel function."

- = upper (A1) → ~~Excel~~ functions EXCEL FUNCTION
- = lower (A1) → excel functions
- = proper (A1) → Excel functions

5 How does the find functions differ from the SEARCH function?

Both FIND and SEARCH locate the position of a character or text within a string.
• FIND is case - sensitive and does not allow wildcards

• SEARCH is not case - sensitive and allows wildcards like * and ?

example :

Text "Excel"

• = FIND ("e" ; "EXCEL" → Error

• = SEARCH ("e" ; "EXCEL" → 1

6 What does the Replace function do and how would you use it?

The REPLACE functions replaces part of a text string with new text based on position.

Syntax :

= REPLACE (old - text, start - num, num - chars, new - text)

example:

If A1 = "EXCEL 2010"

= REPLACE (A1, 6, 4, "2024")

Returns "EXCEL 2024".

⑦ Can you explain how to use the paste special feature to transpose data?

The Transpose option in paste special is used to change rows into columns or columns into rows.

Steps:

1. select and copy the data
2. Right - click on the destination cell
3. click paste special.
4. check Transpose and click ok.

⑧ What are the different options available in paste special, and when would you use them?

Paste special provides several options such as:

- values - pastes only the result not the formula
- Formulas - Pastes formatting only

- Transpose - switches rows and columns
- operations - add, subtract, multiply, divide

How do you copy and paste only the values from a formula into another cell?

To paste only values

1. copy the cell containing the formula
2. Right - click on the destination cell
3. Choose paste special - values

10. describe a scenario where you would use the paste special feature.

Paste Special is useful when copying calculated results into a final report. For example, after calculating total sales using formulas, you may want to paste only the values to prevent change if source data is modified. It is also useful for formatting transposing data and performing operations during paste.
