

Sort, Filter, Auto filter, Custom Filter; Advanced filter,
unique records.

1) How do you sort data in excel by multiple columns?

→ Sorting data by multiple columns allows excel to sort records using more than one criterion. First, select the entire data set. Go to the data tab and click Sort. In the sort dialog box, choose the primary column in the sort by field and select the order (A-Z or Z-A). Then click Add level to include another column and define its order.

Excel first sorts by the primary column, and if values are the same, it sorts by the next column.

② explain the difference between Auto Filter and Advanced Filter in excel.

→ Auto filter is a simple filtering tool used to quickly filter data directly in the same location using drop-down arrows in headers. It is suitable for basic criteria.

Advanced filter, on the other hand, is more powerful and flexible.

③ How would you use a custom filter to display specific data in excel?

→ To use a custom filter, select the dataset and apply filter from the data tab. click the filter drop-down arrow in the desired column and choose Text filters, Number filters, or date filters, select custom filter, then specify conditions such as equal, contains, greater than or, less than - you can also combine two conditions using AND/OR. click OK to display only the records that meet the specified criteria.

Q4) What steps would you take to filter out duplicate records in a dataset?

→ To filter out duplicate records, select the dataset and go to the data tab. Click Advanced filter, choose the option filter the list, in-place or copy to another location.

Check the box unique records only and click ok. Excel will remove or hide duplicate records, showing only unique values based on the selected columns.

Q5) How do you use the Advanced filter to copy filtered data to another location?

→ First, prepare a criteria range with column headings and conditions. Select the dataset and go to data → Advanced filter - choose copy to another location. Specify the list range, criteria range, and copy to destination cell. Click ok. Excel

copies only the filtered records to the specified location without changing the original data.

Q6) What is the purpose of the sort & filter options in Excel?

→ To sort & filter options help users organize and analyze data efficiently. Sorting arranges

data in ascending or descending order based on selected columns. filtering temporarily hides unwanted data and displays only records that meet specific conditions.

⑦ How do you apply a custom sort order in excel?

→ To apply a custom sort order, select the dataset and go to data → sort. Choose the column to sort and select custom list from the order drop-down. Create or select a predefined list (eg, low, medium, high). Click OK. excel sorts the data according to the custom-defined order instead of alphabetical or numerical order.

⑧ Explain the process of using the Advanced filter to extract unique records.

→ Select the dataset and open data → Advanced filter. Choose either filter the list, in-place or copy to another location. Check the unique records only option. Specify ranges if required and click OK. excel extracts only unique records by removing duplicates, which is useful for data validation and reporting.

9) How do you create a filter to show only records that meet multiple criteria?

→ To filter data with multiple criteria, use Auto filter or Advanced filter. In Auto filter, apply filters to multiple columns or use custom filter with AND/OR conditions. In Advanced filter, define multiple conditions in the criteria range using the same row for AND conditions and different rows for OR conditions.

10) What is the difference between filtering data in-place and copying it to another location?

→ Filtering in-place hides records that do not meet criteria within the original data set, keeping data in the same location. Copying to another location extracts filtered records and places them in a new range while keeping the original data unchanged.
