

Power pivot solver

① what is power pivot and how does it extend the capabilities of excel?

→ power pivot is an advanced data modeling add-in in excel that allows users to work with large datasets from multiple tables. It extends excel's capabilities by enabling the creation of relationships between tables, performing complex calculations using DAX (Data Analysis Expressions) and handling millions of rows of data efficiently.

② How do you import data into power pivot from multiple sources?

→ Data can be imported into power pivot by going to the power pivot tab → manage → Get external data. Users can import data from various sources such as excel files, CSV files, databases (SQL Server, Access) and online source.

③ Explain the process of creating relationships between tables in power pivot.

→ To create relationships, open the power pivot window and switch to diagram view.

may a common key column (such as customer ID) from one table to the corresponding column in another table. Alternatively, use DESIGN → Create Relationship and specify the related tables and columns.

④ How would you create calculated columns and measures in power pivot?

→ Calculated columns are created by selecting a table in the power pivot window and entering a DAX formula in an empty column to compute row-level values. Measures are created using New Measure and are used for aggregations like SUM, AVERAGE, or COUNT.

⑤ What is the purpose of the Solver add-in in excel?

→ The Solver add-in is an optimization tool used to find the best possible solution for a problem by changing multiple variables within given constraints. It is commonly used in decision-making scenarios such as cost minimization, profit maximization, and resource allocation.

⑥ How do you set up constraints in Solver to optimize a solution?

→ To set up constraints, open data → Solver and define the objective cell and variable cells. Click Add under Constraints and specify limits such as maximum, minimum, equality or integer restrictions. Multiple ~~and~~ constraints can be added to control the solution.
